

"House Price Prediction - Summary"

Task 5 — Insights & Summary

Which features influence house price the most?

How accurate was your model (in plain terms)?

What surprised you in the data?

One recommendation for a real estate business based on your

The correlation heatmap reveals that a property's overall 'area' and the number of 'bathrooms' are the strongest positive drivers of house prices. Our Linear Regression model achieved practical accuracy, explaining roughly 65% of the mathematical variance in real estate pricing. The most surprising finding during the modeling phase was that the simpler Linear Regression algorithm beat the highly complex Random Forest Regressor; the relatively small size of our dataset caused the Random Forest to severely overfit (scoring 94% in training but crashing to 61% in testing). The primary recommendation for a real estate business is to prioritize capital toward property expansion or bathroom additions before listing, as these specific features yield the highest mathematical return on the final sale price.
